Supplementary File: Births by Sex and Life Expectancy at Age 60

File: WPP2024_Supplement_Births_and_LE60.csv

What it is

A companion file to the WPP 2024 Demographic Indicators (Medium) file. It adds five indicators that the codebook (the notes file) describes but that are not columns in the Medium or OtherVariants data files. The UN's Excel version of the indicators file does not contain them either.

What is in it

Column	Description	Unit
LocID	UN location code, same as in the Medium file	—
ISO3_code	Three-letter country code, same as in the Medium file	—
Location	Location name, same as in the Medium file	—
Time	Calendar year	—
BirthsMale	Male live births	thousands
BirthsFemale	Female live births	thousands
LE60	Life expectancy at age 60, both sexes	years
LE60Male	Male life expectancy at age 60	years
LE60Female	Female life expectancy at age 60	years

Coverage: 236 countries or areas, 1950–2100, one row per location per year (35,636 rows), with no blank values. Years through 2023 are estimates and 2024 onward are projections, as in the Medium file. Births are in thousands to match the Births column; life expectancy is rounded to three decimals.

Where it comes from

Extracted from the UN Population Division Data Portal (World Population Prospects 2024 revision): the indicators “Total births by sex” and “Life expectancy E(x) – complete” at age 60, medium projection (the portal labels it “Median”). Values were converted to the units above; nothing else was changed.

Things to know

- Holy See has no rows. It appears in the Medium file but was not in the portal downloads.
- Rounding. The portal gives births as whole numbers. For locations with few births per year, the male-to-female ratio from these columns can differ noticeably from the SRB column in the Medium file, so use SRB when you need the ratio.
- Consistency checks. Male plus female births match Births in the Medium file to within 0.001, and LE60 for both sexes always lies between the male and female values.
